

Real Estate Management System (REMS)

Deep Viva Questions and Answers

1. What is Real Estate Management System?

A Real Estate Management System is a web-based application used to manage property details, agents, customers, and property searching digitally.

2. What is the main aim of your project?

The main aim is to replace manual property management with a computerized system that is faster, easier, and more efficient.

3. Which technologies are used in your project?

Frontend: HTML, CSS, JavaScript. Backend: PHP. Database: MySQL. Tools: XAMPP and VS Code.

4. Explain the Waterfall Model.

The Waterfall Model is a step-by-step software development process including Requirement Analysis, System Design, Coding, Testing, Deployment, and Maintenance.

5. What is Requirement Analysis?

Requirement Analysis is the process of identifying system needs and functionalities before development.

6. Explain System Design.

System Design defines the structure and architecture of the project including frontend, backend, and database.

7. What is the role of Admin?

Admin manages users, controls the system, and monitors activities.

8. What is the role of Agent?

Agents can add, update, and manage property details.

9. What can Customers do?

Customers can search and view properties based on their needs.

10. Why did you use PHP?

PHP is easy to learn, open-source, and supports database connectivity for web applications.

11. Why did you use MySQL?

MySQL stores and manages property and user data efficiently.

12. What is XAMPP?

XAMPP is a local server environment used to run PHP and MySQL applications locally.

13. What is VS Code?

VS Code is a lightweight source code editor developed by Microsoft with debugging and extension support.

14. Explain Search Functionality.

Search functionality allows users to search properties using filters like location, price, and property type.

15. What are the advantages of your project?

Advantages include reduced paperwork, time saving, easy property searching, centralized database, and improved efficiency.

16. What are future enhancements?

Future enhancements include mobile app support, Google Maps integration, online payments, and notification systems.

17. Explain Frontend and Backend.

Frontend is the visible interface users interact with. Backend handles logic, database operations, and server processing.

18. What challenges did you face?

Challenges included database connectivity, responsive design, error handling, and implementing search functionality.

19. Explain Testing.

Testing ensures the system works correctly. Functional testing, database testing, and UI testing were performed.

20. Explain your project in short.

The Real Estate Management System is a web application developed using HTML, CSS, JavaScript, PHP, and MySQL to manage property details digitally.

2 Minute Project Explanation

My project is a Real Estate Management System developed using HTML, CSS, JavaScript, PHP, and MySQL. The main aim is to replace manual property management with a digital system. The project includes Admin, Agent, and Customer modules. Agents can add and update properties, while customers can search and view properties. The project uses Waterfall methodology and three-tier architecture. The system reduces paperwork, improves efficiency, and saves time.
